Geospatial Tools and Techniques for Public Safety

Ed Freeborn¹

¹Unmanned Experts

The Frontier Day Public Safety Track will address the theme of “Where is the World Headed?” In this case, world we are talking about is public safety’s use of airborne and terrestrial photogrammetry, lidar, 3-D and other geospatial technologies, particularly from a forensic perspective. Currently ASPRS is looking at the role the Society can play in providing a scientific basis and facilitating technology assistance to law enforcement and criminal justice practitioners for capturing, processing, presenting and managing valid and reliable forensic quality data with these technologies. This track will present an overview of where this world is headed, along with some examples of enabling technologies. A panel session will provide an opportunity for practitioners from the public safety, criminal justice, and imaging and geospatial information technology fields to discuss the future of this brave, new world and how ASPRS is helping to shape it.
