

THE REPUBLIC OF ANGOLA

The contents of this column reflect the views of the author, who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the American Society for Photogrammetry and Remote Sensing and/or the Louisiana State University.

The original peoples of what is now Angola were probably Khoisan speaking hunters and gatherers (bushmen). During the first millennium AD, large-scale migrations of Bantu speaking people moved into the area and eventually became the dominant ethno-linguistic group of southern Africa. The most important Bantu kingdom in Angola was the Kongo, with its capital at Mbanza Kongo (called *São Salvador do Congo* by the Portuguese). South of the Kongo was the Ndongo kingdom of the Mbundu people. Angola got its name from the title for its king, the **ngola**. In 1483, Portuguese explorers reached Angola, Christianized the ruling family, and engaged in trade and missionary work. By the early 17th century, some 5,000+ slaves were being exported from Luanda annually. Angola received its independence from Portugal in 1975, but has been plagued by civil war and insurrections since independence. A familiar Bantu word in the U.S. is kwanza, which is Angola's unit of currency.

The interior forms part of the Central African Plateau, with elevations that range from 1,220 to 1,830 m (4,000 to 6,000 ft). The coastal plain is about 1,610 km long (1,000 miles) and varies in width from 48 to 160 km (30 to 100 miles). The highest point is Mt. Moco in the west at 2,559 m (8397 ft). The chief rivers include the Congo, Cuanza, and Cuene to the north, while south of the Lunda Divide some flow into the Zambezi River and others flow into the Okavango River.

Angola consists of two geographically separate expanses: Angola proper and Cabinda. Portuguese au-

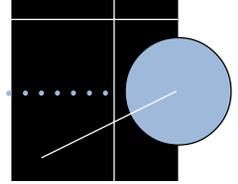

thority was not exercised continuously north of the Congo River in the present-day district of Cabinda until a relatively recent date. It was occupied by the Portuguese in 1783, but a French expedition forced them to evacuate the area 11 months later. Portugal laid definite claim to Cabinda in an additional convention to the Anglo-Portuguese treaty of January 22, 1815. Again, on February 26, 1884, an Anglo Portuguese treaty acknowledged claims by Portugal that included not only Cabinda and the Congo River inland to Nóqui but the whole Atlantic coast between 5° 12' and 8' South latitude. This produced a storm of protests in Europe, and Portugal proposed a conference on the Congo that resulted in the Berlin Conference held between November 15, 1884 and February 26, 1885. Consider then, that the borders of Cabinda are in common with Congo (Brazzaville), which was part of the former Congo Français (French Congo), and is currently the Republic of the Congo. The southern border is in common with Congo (Kinshasa), once the Belgian Congo, later called Congo, then Zaire, and currently the Democratic Republic of Congo. The controlling classical datum for southern Africa and most surrounding countries of Angola proper is the Arc Datum of 1950 whose point of origin is station Buffelsfontein where $\Phi_0 = 33^\circ 59' 32.00''$ South, $\Lambda_0 = 25^\circ 30' 44.622''$ East of Greenwich, and the azimuth from south to station Zuurburg is $\alpha_0 = 183^\circ 58' 15''$. The reference ellipsoid for the Arc 50 Datum is the Clarke 1880 where the semi-major axis $a = 6,378,249.145$ m and the reciprocal of flattening $1/f = 293.465$. Angola's southern border is with that country once called German Southwest Africa, and Namibia is the only country in the African continent to utilize the Bessel 1841 ellipsoid for its Schwarzeck Datum where, for Namibia, the semi-major axis $a = 6,377,483.865$ International

meters and the semi-minor axis $b = 6,356,165.383$ International meters. Values actually used in Namibia are $a = 6,377,483.865$ *legal* meters and $1/f = 299.1528128$. The origin point is Schwarzeck, near Gobabis, where $\Phi_0 = 22^\circ 45' 35.820''$ South, and $\Lambda_0 = 18^\circ 40' 34.549''$ East of Greenwich. (Our Paul M. Hebert School of Law here at Louisiana State University is helping build a Law Library at the University of Namibia).

The earliest geodetic observation in Angola is to the 1884 meridional distance from the mid-Atlantic island of St. Helena to Baie dos Elefantes (Elephant Bay) in Angola and thence north to São-Paulo de Loanda (Luanda). This revealed a probable error between 6' and 6½' in longitude in the existing Portuguese charts. This error was again reported in 1888 in a "Hydrographic Note" using meridional distances from Cape Town Observatory to the two ports mentioned above and to Moçâmedes. In 1891, *ANNALES HYDROGRAPHIQUES* of the French Navy published the telegraphic determination of longitudes for three sites in Angola as determined by Commander Pullen of the Royal English Navy. Those determinations were São-Paulo de Loanda – at the pavilion slab of the Fort of San Miguel – where $\Phi_0 = 08^\circ 48' 24''$ South, $\Lambda_0 = 10^\circ 53' 05''$ East of Paris, Benguela – at the Bureau Télégraphique (Telegraph Office) – where $\Phi_0 = 12^\circ 34' 43''$ South, $\Lambda_0 = 11^\circ 03' 40''$ East of Paris, and Moçâmedes – at the pavilion slab of Ponta da Noronha – where $\Phi_0 = 12^\circ 34' 43''$ South and $\Phi_0 = 11^\circ 03' 40''$ East of Paris.

In 1918, the Portuguese authorities established a new position for Luanda Observatory and supplied details of the triangulation of that area. "A Missão Geográfica de Angola criada na ...," "The Geographic Mission of Angola was cre-

(the same as used in the U.S. for the North American Datum of 1927) where $a = 6,378,206.4$ m and $b = 6,356,583.8$ m. The only transformation parameters I have ever been able to scrounge from this Datum to WGS84 were obtained from Prof. Charles L. Merry at the University of Cape Town where $\Delta X = -49$ m, $\Delta Y = -301$ m, and $\Delta Z = -181$ m; and Prof. Merry estimates the accuracy at ± 60 meters. According to Hager, "some-time in the 1960s or 1970s, DMA was asked to put Angola, then on the Camacupa Clarke 1866 Datum, on the Camacupa Clarke 1880 and the Arc 50 Datums. The Portuguese provided all the coordinates based on the Clarke 1866 Datum. They also provided tables to convert from the Clarke 1866 Datum to the Clarke 1880 Datum assuming that the tangent point of the two ellipsoids was at Camacupa. I think that the tie was on the 12th Parallel South to the Zambian Triangulation. (It was). The 6th Parallel south and Bas Congo surveys of Congo occupy common points with the Angola surveys and were adjusted to the Arc Datum of 1950. A comparison of the Angola values showed that Arc 50 Datum in Angola was adequate for mapping purposes. Angola is on the UTM Grid. I did find a local grid for Luanda and would expect other similar ones. For Luanda, the 1:2,000-scale city map plots directly on top of the UTM Grid of the 1:100,000-scale map. The 50,000 50,000 intersection is, in UTM coordinates, N = 9,024,000 and E = 306,000. This then results in a local Grid, Transverse Mercator projection, Clarke 1880 ellipsoid, $\phi_0 = 0^\circ$, $\lambda_0 = 15^\circ$ E, FN = 1,026 km, FE = 244 km, and $(m_0) = 0.9996$. The UTM scale factor at local 50,000 50,000 is 1.00006581. A unity scale factor would be expected for a City Grid, and this is pretty close to unity. The math for the false coordinates is FN = 10,000,000 - 9,012,000 + 50,000 = 1,026,000 and FE = 500,000 - 306,000 + 50,000 = 244,000." The Camacupa Clarke 1880 Datum is oftentimes referred to by the hydro-

graphic community as the Camacupa-Vumbatumba Datum of 1950 based on the origin surveyed by MHCA in 1950 as $\Phi_0 = 06^\circ 26' 17.111''$ South and $\Lambda_0 = 12^\circ 27' 22.978''$ East of Greenwich. Transformation parameters used by Western Geophysical from the Camacupa-Vumbatumba Datum of 1950 to the WGS 84 Datum are $\Delta X = -39.44$ m, $\Delta Y = -353.66$ m, and $\Delta Z = -224.16$ m, and the transformation parameters used by the British Navy are $\Delta X = -48.81$ m, $\Delta Y = -343.58$ m, $\Delta Z = -228.32$ m, ± 10 meters for the northern part of the country.

Thanks to parameters published into the public domain by the European Petroleum Studies Group (EPSG) headed up by Mr. Roger Lott of British Petroleum, there are a number of transformations from the Clarke 1880 version of the Camacupa Datum of 1948. For instance, Camacupa 1948 to WGS 72BE: $\Delta X = -37.2$ m, $\Delta Y = -370.6$ m, and $\Delta Z = -228.5$ m; this was derived by Geophysical Services, Inc. in 1979. Camacupa 1948 to WGS84, used by Conoco for Offshore Block 5: $\Delta X = -42.01$ m, $\Delta Y = -332.21$ m, and $\Delta Z = -229.75$ m. Camacupa 1948 to WGS84 and used by Topnav at PAL F2, by Elf in blocks 3 and 17 since 1994, and by Total in block 2 since 1994: $\Delta X = -50.9$ m, $\Delta Y = -347.6$ m, and $\Delta Z = -231$ m. An additional eight versions of parameters are used for the "same" transformation in offshore areas spanning the entire coast of Angola.

The MHASt Datum of 1951 (Missão Hidrográfica de Angola e São Tomé) fundamental point is a concrete block, point Y, at Malongo lighthouse that is at $\Phi_0 = 05^\circ 23' 30.81''$ South, $\Lambda_0 = 12^\circ 12' 01.59''$ East of Greenwich, and is referenced to the International ellipsoid of 1924 where $a = 6,378,388$ m and $1/f = 297$. From MHASt to WGS84: $\Delta X = -252.95$ m, $\Delta Y = -4.11$ m, and $\Delta Z = -96.38$ m.

The Malongo Datum of 1987 replaced the MHASt Datum of 1951, and is also referenced to the same fundamental point (new coordinates

unknown). The same ellipsoid is used; however, the transformation parameters have changed to become Malongo 1987 Datum to WGS 84: $\Delta X = -254.10$ m, $\Delta Y = -5.36$ m, and $\Delta Z = -100.29$ m, thanks to Mal Jones of Perth, Australia.

Hager went on to say; "A survey was done across Congo (Kinshasa) connecting Angola proper to Cabinda but the data were destroyed by a fire in Lisbon so Cabinda is on a local datum. About all the booklet for Cabinda will say is that it is not on Camacupa 1948 Datum. The values of the boundary marks in the northwest of Cabinda are in agreement with those published by (the French) IGN and used by Congo (Brassaville)."

Other datums existing in Angola include the Lobito Datum of 1937 based on the origin point at the astronomical pillar Restinga do Lobito, Extremo NE da Base do Lobito, where $\Phi_0 = 12^\circ 19' 00.86''$ South, $\Lambda_0 = 13^\circ 34' 45.67''$ East of Greenwich, Clarke 1866 ellipsoid. Dr. José Carvalho of Maputo, Moçambique states that the Camacupa Datum of 1948 coordinates of the same point are $\Phi_0 = 12^\circ 19' 01.357''$ South, $\Lambda_0 = 13^\circ 34' 58.375''$ East of Greenwich. The transformation from the Lobito 1937 Datum to the WGS 84 Datum is $\Delta X = -256.73$ m, $\Delta Y = 0.00$ m, and $\Delta Z = -103.67$ m (± 10 m).

The Luanda Datum is based on the origin point at Luanda Observatory where $\Phi_0 = 08^\circ 48' 46.8''$ South, $\Lambda_0 = 13^\circ 13' 21.8''$ East of Greenwich, Clarke 1866 ellipsoid. The Moçamedes Datum of 1956 origin point is at the Moçamedes Meteorological Station where $\Phi_0 = 15^\circ 11' 16.34''$ South, $\Lambda_0 = 12^\circ 07' 34.53''$ East of Greenwich, Clarke 1866 ellipsoid.

Many thanks to Sequoia Read of the Defence Geographic Centre and the Geodesy Section of the United Kingdom Hydrographic Office.
