

# Republic of Zambia

by Clifford J. Mugnier, C.P., C.M.S.

Evidence has been found north of Lusaka at Kabwe of human habitation that dates back 100,000 years. About 1000 AD, Swahili-Arab slave traders began intrusions into the area from the east. Between the 14<sup>th</sup> and 16<sup>th</sup> centuries, the Bantu-speaking Maravi migrated from the area presently known as Zaïre, and established kingdoms in eastern and southeastern Zambia. The region came under the jurisdiction of the British South Africa Company in 1889, in 1911 it became Northern Rhodesia, and in 1924 it became a British Protectorate. From 1953 to 1963, it was part of the Federation of Rhodesia and Nyasaland (Malawi) and achieved independence as a republic 40 years ago this month on 24 October 1964. Zambia is bordered by Angola (1,110 km) (PE&RS, March 2001), Democratic Republic of the Congo (1,930 km), Malawi (837 km), Moçambique (419 km) (PE&RS, September 1999), Namibia (233 km), Tanzania (338 km), and Zimbabwe (813 km) (PE&RS, November 2003). The climate is tropical, modified by the altitude of the mostly high plateau with some hills and mountains. The lowest point is the Zambezi River (329 m), and the highest point is in the Mafinga Hills (2,301 m).

Lake Tanganyika extends into a small portion of northern Zambia, and the Zambezi River (used as the origin of the country's name) forms the eastern border with Malawi. The famous Arc of the 30<sup>th</sup> Meridian follows the eastern shore of Lake Tanganyika and spans the Zambezi River. The Arc of the 30<sup>th</sup> Meridian is referenced to the Cape Datum of 1950 where the astronomic coordinates of the initial point of the Cape Datum near Port Elizabeth are for Buffelsfontein where  $\Phi_0 = 33^\circ 59' 32.000''$  S and  $\Lambda_0 = 25^\circ 30' 44.622''$  E. The ellipsoid of reference is the Clarke 1880, where  $a = 6,378,249.145$  m and  $1/f = 293.4663077$ .

The northwestern border of Zambia is common with the Democratic Republic of the Congo (Zaïre), once known as the Belgian Congo. Zambia is adjacent to the Katanga province of the Congo, where a boundary commission published the results of a classical triangulation in 1954, *Comité Spécial du Katanga, Les Travaux Géodésiques du Service Géographique et Géologique*. The origin of the triangulation of Katanga (Le Point Fondamental) is the "A" end of the Tshinsenda baseline in Zam-

bia where:  $\Phi_0 = 12^\circ 20' 31.568''$  S and  $\Lambda_0 = 28^\circ 01' 02.971''$  E. The altitude of the point was 1,331.31 m, as determined by trigonometric leveling from the 30<sup>th</sup> Arc triangulation performed in 1911. Subsequent double-run precise levels performed by then Major and later Brigadier Martin Hotine from Dar es Salaam in Tanzania necessitated a correction of +47 feet to the elevations in Zambia. Presumably, that correction was applied to the value published by the Belgians in 1954. The Tshinsenda Baseline was measured in 1912 with a length of 4,152.9912 m with the final value being adjusted with the base at Nyanza, both surveyed by the Katanga-Rhodesia Boundary Commission. The deflection of the vertical was constrained to zero at point "A". The projection adopted for the general map of Katanga was the Lambert Conical Orthomorphic with two standard parallels at  $\phi_N = 6^\circ 30'$  S and  $\phi_S = 11^\circ 30'$  S and a central meridian,  $\lambda_0 = 26^\circ$  E.

Thanks to a paper in *Survey Review*, April 1997 by Dare and Mutale, a brief history of geodetic surveys in Zambia were detailed: "Between 1949 and 1964, the Directorate of Colonial Surveys, Federal Surveys, and the Directorate of Overseas Surveys, established 12 triangulation nets and three traverse loops. The main areas of primary control may be grouped as follows: Part of Arc of the 30<sup>th</sup> Meridian; Fort Jameson (Chipata)/Malawi Network; Isoka Network; Zambia Main Network; Copperbelt Network; Solwezi/Kasama/Mumbwa Loop; Fort Rosebury (Mansa) – Congo (Zaire) link; Livingstone Memorial Area – Mansa Loop; Mwinilunga Loop Traverse; Luwingu series and Mansa loop; Mankoya loop Traverse; Kalomo Livingstone loop Traverse. The network configuration consists of (a) Triangles; (b) Braced quadrilaterals; (c) Centre point polygons; (d) Double centred polygons; (e) Traverse legs. As a rule of thumb, the orientation was controlled by azimuth observations every 10 stations and the allowable misclosure was not to exceed  $2''\sqrt{n}$ , where  $n$  is the number of intervening legs between astronomical stations. The side lengths in primary traverse are approximately 30 km; in other cases the lengths of sides are approximately 60 km. For (a)-(d) a deliberate effort was made to have well conditioned triangles by avoiding angles less than 40 degrees."

The Tshinsenda baseline is located in the Copperbelt Province of Zambia. Since the world market in copper has plummeted, the economy of Zambia has suffered and great efforts are being expended to convert the economy to an agricultural base. The majority of papers on surveying and mapping topics published on Zambia are now addressed to the establishment of a national cadastre for a land registration system. Land tenure through 99-year leases is a current topic thought to be the country's economic salvation. Professor Peter Nsombo published a paper with L. Combrinck of the Hartebeeshoek Radio Astronomy Observatory regarding the establishment of a continuously observing reference station in Lusaka (ZAMB). The transformation parameters expressed in the standard American convention sign for rotations from Arc Datum 1950 to WGS84 Datum for **all** of Zambia are:  $\Delta X = -152$  m  $\pm 0.4$  m,  $\Delta Y = -60$  m  $\pm 0.4$  m,  $\Delta Z = -297$  m  $\pm 0.4$  m,  $R_x = -12'' \pm 0.4''$ ,  $R_y = 1'' \pm 0.8''$ ,  $R_z = 8'' \pm 1''$ ,  $\Delta s = -8.328 \pm 1.773$  ppm, and this solution was based on 11 observed points. A pilot project was undertaken in an area of Lusaka that developed transformation parameters that were different from the above parameters in excess of 10 meters per translation component. As a basis of comparison, NGA lists the 3 parameter transformation from Arc 1950 to WGS 84 as:  $\Delta X = -147$  m  $\pm 21$  m,  $\Delta Y = -74$  m  $\pm 21$  m,  $\Delta Z = -283$  m  $\pm 21$  m, and this solution was based on 5 points.

Thanks to Malcolm A. B. Jones of Perth, Australia for the Katanga data.

**Cliff Mugnier** teaches Surveying, Geodesy, and Photogrammetry at Louisiana State University. He is the Chief of Geodesy at LSU's Center for GeoInformatics (Dept. of Civil and Environmental Engineering), and his geodetic research is mainly in the subsidence of Louisiana and in Grids and Datums of the world. He is a Board-certified Photogrammetrist and Mapping Scientist (GIS/LIS), and he has extensive experience in the practice of Forensic Photogrammetry.
