The northern coast of Brazil was explored by Vicente Pinzón, a Spaniard, in 1500 although theoretically already allotted to Portugal by the 1494 Treaty of Tordesillas. Brazil was not formally claimed by discovery until the Portuguese navigator Pedro Álvares Cabral accidentally touched there also in 1500. The native Indians spoke languages that scholars have classified into four families: the Ge speakers, originally spread along the coast and into the central plateau and scrub lands; the Tupi speakers, who displaced the Ge on the coast and hence were the first met by the Portuguese; the Carib speakers in the north and in Amazônia, who were related distantly to the people who gave their name to the Caribbean; and the Arawak speakers in Amazônia, whose linguistic relatives ranged up through Central America to Florida; and, according to sociologist Donald Sawyer, the Namíbicuara in northwestern Mato Grosso. Brazil’s history prior to becoming an independent country in 1822 and a republic in 1889 is intertwined mainly with that of Portugal. Unlike the other viceries of Latin America, which divided into twenty countries upon attaining independence, the Viceroyalty of Brazil became a single nation, with a single language transcending all diversities and regionalisms. Brazil is the only Portuguese-speaking Latin American country, and its Luso-Brazilian culture differs in subtle ways from the Hispanic heritage of most of its neighbors (Library of Congress Country Studies, 2008).

Beginning in the early 19th century, the Instituto Geográfico e Geológico do Estado São Paulo produced the first 1:100,000 scale base map of the nation. In 1909, the Diretoria do Serviço Geográfico do Exército, (Directorship of the Army Geographic Service), produced some 1:10,000 scale sheets, and in 1913 or 1914, terrestrial photogrammetry was first used in Brazil. In 1917, the Serviço Geográfico Militar, (Military Geographic Service) was founded. In 1922, the first map compiled using aerial photogrammetric procedures was published of the Distrito Federal (Topographic Mapping of the Americas, Australia, and New Zealand, M.A. Larsgaard, 1984).

The Conselho Nacional de Geografia (National Council of Geography) is responsible for the Instituto Brasileiro de Geografia e Estatística (IBGE) (Brazilian Institute of Geography and Statistics). Founded in 1937, this civilian agency is the primary national source of public information and data on geodesy and mapping.

With such an enormous country and long history, there have been extensive surveys and mapping projects with concomitant grids and datums established in Brazil. According to TM 5 – 248, Foreign Maps. “In 1925 the Brazilian Government adopted the Hayford International ellipsoid of 1909 ($a = 6,378,388$ m, $b = 6.356,583.8$ m. – Ed.) Prior to 1925 the Clarke spheroid of 1866 had been used ($a = 6,378,206.4$ m, $b = 6,356,583.8$ m. – Ed.).” In 1952, a cooperative agreement was signed between the Brazilian Army and the U.S. Army Map Service and the Inter-American Geodetic Survey (IAGS). The following paragraph is a compilation of all known astronomical positions in Brazil, mostly published by the various Anuários (IAGS). The following paragraph is a compilation of all known astronomical positions in Brazil, mostly published by the various Anuários of the Diretoria do Serviço Geográfico do Exército. Some of these may indeed represent small datums established for local city uses but are not generally considered major datums within the country.

The “Abrolhos Lighthouse” is approximately: $\Phi_0 = –17^\circ 57' 32'' W$, $\Lambda_0 = –38^\circ 38' 42'' W$, and is likely the origin for a local hydrographic survey. Located on Santa Bárbara Island and part of an archipelago, it is a popular tourist destination for viewing whales. The “Barreira do Monte 1941” origin is: $\Phi_0 = –08^\circ 00' 31.1'' \pm 0.2'' S$, $\Lambda_0 = –34^\circ 51' 15.2'' \pm 0.6'' W$, and is in the State of Pernambuco. The “Base Este do Forte de Coimbra 1945” origin is $\Phi_0 = –19^\circ 55' 17.00'' S$, $\Lambda_0 = –57^\circ 47' 33.75'' W$, and is likely the origin for a local hydrographic survey. Located on Santa Bárbara Island and part of an archipelago, it is a popular tourist destination for viewing whales. The “Barreira do Monte 1941” origin is: $\Phi_0 = –08^\circ 00' 31.1'' \pm 0.2'' S$, $\Lambda_0 = –34^\circ 51' 15.2'' \pm 0.6'' W$, and is in the State of Pernambuco. The “Base Este do Forte de Coimbra 1945” origin is $\Phi_0 = –19^\circ 55' 17.00'' S$, $\Lambda_0 = –57^\circ 47' 33.75'' W$, and is located on the Paraguay River in the State of Mato Grosso. The site of many historical battles dating from the 18th century, it maintains an artillery garrison to this day. The “B of Base Luis Correa” origin in the State of Plaú is approximately...
Φ₀ = –02° 53′ 01″ S, Λ₀ = –41° 39′ 58″ W. The “Centro da Base Mato Grosso 1937” origin is: Φ₀ = –20° 27′ 01.7″ S, Λ₀ = –54° 38′ 58.3″ W, and H₀ = 578.38 m. The “Extremo B2 da Base da Fortaleza 1944” origin is: Φ₀ = –03° 42′ 31.4″ S, Λ₀ = –38° 34′ 36.6″ W and is located in the State of Ceará, a popular coastal destination of Brazilian tourists. The “Extremo S.E. da Base 1939” at point B₂ origin is: Φ₀ = –21° 42′ 11.7″ S, Λ₀ = –43° 24′ 55.4″ W, H₀ = 68.50 m, and is in the State of Minas Gerais. The islands of Fernando de Noronha are located 540 km off the Recife coast; the archipelago is made up of 19 islands, and only two of them are inhabited; the largest island has an area of 16.2 km². There are a few versions about the discovery of the island; the most accepted version is that Italian navigator Américo Vespúcio came across Noronha in 1503, when at service of the Portuguese King, he commanded a fleet that explored the Brazilian coast. In past centuries, Fernando de Noronha was invaded by the Dutch, the French and the British, all wanting to establish a base in a strategic spot. In the 19th century, the island became a penal colony; during this period, the forests were cut down to prevent prisoners from using the trees to build boats and escape. More recently during the Brazilian Military Period, Noronha was used to isolate political prisoners. In 1942, Noronha became a Federal Territory. After the Federal Constitution of 1988, Noronha was turned into a District of the State of Pernambuco. The origin is approximately Φ₀ = –03° 54′ 00″ S, Λ₀ = –32° 25′ 00″ W. The State capital of Ceará is Fortaleza, and the origin of “Fortaleza 1942” is at “Porta da Base” where: Φ₀ = –03° 45′ 10″ S, Λ₀ = –38° 19′ 44″ W, H₀ = 657.31 m. “Itararé” is also located in São Paulo State and its approximate coordinates are: Φ₀ = –24° 06′ 55″ S, Λ₀ = –49° 17′ 55″ W. The “Pico do Jaraguá” origin is located on the highest mountain in the city of São Paulo where: Φ₀ = –23° 27′ 08.054″ S, Λ₀ = –46° 45′ 51.201″ W. The “Extremo Nordeste da Base de Leste 1904” origin has its latitude listed as: Φ₀ = –30° 20′ 52.00″ S and is located in Porto Alegre, the capital of the State of Rio Grande do Sul. The “Macuco 1946” origin in Minas Gerais State is: Φ₀ = –22° 27′ 03″ S, Λ₀ = –44° 26′ 37″ W, H₀ = 449.04 m. “Observatório da Comissão 1906” at the point listed as Observatório da Comissão da Carta Geral do Brasil Pillar in West Room is: Φ₀ = –30° 02′ 14.885″ S ±0.074″, Λ₀ = –51° 13′ 12.660″ W ±0.36″, and
at the point listed as *Mark on the Terrace* is: Φ = 30° 02' 14.762"S ±0.07", λ = 51° 13' 12.660"W±0.36" and has an azimuth to Cavahada as: αc = 38° 40' 16.35"±0.35", both being located in Porto Alegre. The “Observatório Nacional do Rio De Janeiro 1890” origin is: Φ = −22° 53' 42.15"S, λ = −43° 13' 22.5"W, H = 35.18 m. “Pilar Astronômico 1926” origin north of Sorocaba, São Paulo is: Φ = −23° 25' 34"S, λ = −47° 35' 44"W. “Pilar Astronômico de Ponta Grossa 1948” origin is listed as: Φ = −25° 11' 09"S, λ = −50° 08' 37"W, but to my surprise I noticed the point is actually shown in *TM 5 − 248, Foreign Maps* on page 226! The scaled coordinates from that exemplar Brazilian map are: Φ = −25° 11' 31.8"S, λ = −50° 08' 47.3"W, and the point is labeled “Datum,” with H = 794 m. “Pilar do Forte 1937” origin is: Φ = −22° 22' 30"S, λ = −41° 46' 14"W. In the city of Salvador, Bahia, the “Pronto Socorro 1937” origin is: Φ = −12° 59' 31.43"S, λ = −38° 31' 34.95"W, and the azimuth from north to Hospício is: α = 67° 52' 47.20". Located in the vicinity of Santa Vitória do Palmar, Rio Grande do Sul, “Sul S.O. Base 1912” (Extremo S.O.) origin is Φ = −33° 29' 25.85"S±0.10", λ = −53° 19' 41.12"W±0.33". In the State of Santa Catarina, “Très Barra Extremo N.E. da Base 1952” at the Pilar N.E. da Base de Três Barras origin is: Φ = −26° 07' 46.0"S±0.5", λ = −50° 18' 28.80"W±0.53", H = 775.627 m. In Rio Grande do Sul, the “Val de Serra 1947” origin is: Φ = −29° 28' 14.30"S±0.03", λ = −53° 42' 03.27"W±0.24". Thanks to John W. Hager for all of these Astro stations!

The major geodetic datums found in Brazil include: Aratu Datum, Córrego Allegre Datum of 1949, Provisional South American Datum of 1956, South American Datum of 1969, SIRGAS and WGS84. The Córrego Allegre Datum of 1949 *original* origin coordinates are: Φ = −19° 50' 15.14"S, λ = −48° 57' 42.75"W, H = 683.81 m, and azimuth to Chapada das Areias: αc = 128° 21' 48.96". The origin coordinates of Córrego Allegre were *later revised* to be: Φ = −19° 50' 14.91"S, λ = −48° 57' 41.98"W, the defining azimuth was unchanged, and the components of the deflection of the vertical, ξ = η = 0, and the geoid height was constrained to zero (N = 0 m). As stated previously, the ellipsoid of reference was the International Hayford 1924. According to *TR 8350.2*, the 3-parameter transformation values from Córrego Allegre Datum of 1949 to WGS84 are: ΔX = −206 m ±5 m, ΔY = +172 m ±3 m, ΔZ = −6 m ±5 m, and this is based on a 17-station solution. Two major grid systems were associated with the Córrego Allegre Datum of 1949, both being based on the Gauss-Conform Transverse Mercator projection. The 3° belt system started with Belt I at λ = −28° 30' W and continued east to Belt XVI at λ = −73° 30' W. No False Easting or False Northings were used and the Scale Factor at the Central Meridian was equal to unity. The 6° belt system started with Belt I at λ = −30° W and continued east to Belt VIII at λ = −72°W. The False Easting for each belt was 500 km at the Central Meridian, the False Northing was 5,000 km at the Equator, and the Scale Factor at the Central Meridian was 0.999333333. Note that Northing is X, and Easting is Y. On certain small scale maps Brazil uses the Rectangular Polyconic projection, primarily for their 1:1,000,000 International Map of the World Series. I have a copy of those projection tables in Portuguese given to me by my first cousin, Professor Daryl Domning of Howard University when he was doing research on Amazon River Manatees in Manaus during the 1970s. Also included are tables for the Lambert Conformal Conic projection with standard parallels at 0° 40'N and 3° 20'N, and the Polar Stereographic with standard parallels at 76°S and 80°S.

The Provisional South American Datum of 1956 (PSAD56) origin is at La Canoa, Anzoátegui Province, Venezuela where: Φ = +08° 34' 17.10"N, λ = −63° 51' 34.880"W, and the defining azimuth to station Pozo Hondo: α = 40° 22' 45.96". The PSAD56 ellipsoid of reference is also the International 1924. Note however, that *TR 8350.2* does not list any datum transformation parameters for PSAD56 to WGS84 in the country of Brazil although it presumably has been used in the northern reaches of the Amazon Basin.

The astronomic origin coordinates of the South American Datum of 1969 (SAD69) at station Chuá are where: Φ = −19° 45' 41.34"S ±0.05", λ = −48° 06' 07.80"W ±0.08", and the astronomic azimuth to Uberaba: α = 271° 30' 05.42". The corresponding adjusted geodetic coordinates of Chuá are: Φ = −19° 45' 41.6527"S, λ = −48° 06' 04.0639"W, H = 763.28 m, and the geodetic azimuth to Uberaba: α = 271° 30' 04.05". The components of the deflection of the vertical, ξ = +0.31", η = −0.52", and the geoid height was constrained to zero (N = 0 m). The SAD69 ellipsoid of reference is the International 1967 where: a = 6,378,160 m, and 1/f′ = 298.25. According to *Resolução da Presidência da República nº 23, de 21/02/1989*, the following official Brazilian National transformation parameters are from SAD69 to WGS84: ΔX = −66.87 m ±0.43 m, ΔY = +4.37 m ±0.44 m, ΔZ = −38.52 m ±0.40 m. By altering the characterization of the Brazilian Geodetic System and according to *Resolução da Presidência da República nº 24, de 25/02/2005*, the following official Brazilian National transformation parameters are from SAD69 to SIRGAS2000: ΔX = −67.35 m, ΔY = +3.88 m, ΔZ = −38.22 m. Note that the GRS80 ellipsoid parameters are: a = 6,378,137 m, and 1/f′ = 298.257221101.

The Aratu Datum to WGS84 mean three-parameter transformation is: ΔX = −158 m, ΔY = +315 m, ΔZ = −148 m, however there are numerous variants used in the offshore basins by Petrobras as well as by various oil company producers, according to the current EPSG Database, version 6.18. Brazil now uses the UTM Grid on their current map sheets.
