The Republic of Kiribati

Pronounced “kir-ih-bahss,” the islands were originally settled by Austronesians thousands of years ago. Around the 14th century AD, the islands were invaded by Fijians and Tongans. The first recorded European encounter with Kiribati was by the Spanish explorer Quiros in 1606. By 1820, all of the islands had been charted. At that time, the Russian hydrographer A. I. Krusenstern gave the group the name Gilbert Islands. Until 1870, many British and American whaling vessels sought sperm whales in Gilbertese waters. Starting in 1850, trading vessels passed through seeking at first coconut oil and later copra. In the 1860s, slave ships known as “blackbirders” carried off islanders to work in plantations in Peru, Fiji, Tahiti, Hawaii, and Australia. The male population was decimated, and European disease (measles) took a further large toll on the “I’Kiribati” people. The Ellice group (now Tuvalu – PE&RS, December 2001) and the Gilbert Islands became a British Protectorate in 1892. In 1975, the Ellice Islands seceded from the colony and became the independent nation of Tuvalu. On 12 July 1979, Kiribati obtained its own independence from the United Kingdom and became a republic within the Commonwealth.

Kiribati consists of a three-island group: the Gilbert Islands, the Line Islands, and the Phoenix Islands. These groups of islands straddle the equator and the International Date Line, about half way between Hawaii and Australia. In 1995, The Republic of Kiribati proclaimed that all of its territory lies in the same time zone as the Gilbert Islands group (GMT + 12). The total land area equals 717 sq km, about four times the size of Washington, D.C. The country is composed of mostly low-lying coral atolls surrounded by extensive reefs. The lowest point is the Pacific Ocean, the highest point is on Banaba Island (81 m). Twenty of the 33 islands are inhabited, and the capital is Tarawa.

According to Russell Fox of the Ordnance Survey, “We revised our Tarawa 1:50,000 map in 1997 and produced new 1:25,000 photomapping of the Line and Phoenix Islands in 1995/96 using Australian Army aerial photography, but we did not do any geodetic survey work in that decade. I believe that a GPS survey, aerial photography and new mapping (on WGS84) project was planned for Tarawa for 1998/99 under Australian aid. The following notes summarise what we know about Kiribati.

Background: The Republic of Kiribati (pronounced “Kiribass”) comprises the Gilbert, Phoenix and Line island groups in the central Pacific Ocean. Total land area 717 sq km, total sea area 5.2 million sq km, greatest extent 4000 km W-E by 2000 km N-S. The modern republic has its genesis in a British protectorate proclaimed in 1892, which became the Gilbert and Ellice Islands Colony in 1916. Independence was granted to the Gilbert, Phoenix and Line Islands in 1979 as the Republic of Kiribati. The Ellice Islands had previously seceded, in 1975, as the Republic of Tuvalu. The International Date Line passes through Kiribati, but the Government of Kiribati has (legitimately) legislated that the Line and Phoenix Islands will observe the same date as the Gilbert Islands.

Survey history: The Royal Navy carried out hydrographic surveys, based on astro fixes, from the early nineteenth century onward. Little survey and mapping work was done by the British colonial authorities before WW2. Japanese military occupation of the Gilbert Islands in 1941 lead to extensive aerial photography and mapping by the US armed forces, who drove out the enemy in fierce fighting. Post-WW2: Aerial photography: Gilbert Islands RNZAF 1962/63; USN RNZN, British Military Survey and contract staff between 1941 and the 1960s, and by the Kiribati Survey Department in 1979/80. DOS then brought those surveys together, computing on Christmas Island 1967 Astro Datum, International Spheroid, Kiritimati Local [TM] Grid. The first modern survey work in the Phoenix and Line Islands was the precise Doppler campaign of 1984/85. Mapping: DOS produced 1:25,000 (a few sheets were done at 1:12,500 & 1:10,000), photomap series of all the islands between 1972 and 1996. The larger atolls, Tarawa and Kiritimati (Christmas Island), were also mapped at 1:50 000 on single sheets. Generally two editions were produced, one showing the local TM grid, and the other (for military use) UTM grid. Early editions of the Christmas Island sheet showed UTM Grid only. Southern Tarawa was mapped at 1:2500 and 1:1250. All of these classical Datums are referenced to the International 1924 ellipsoid where a = 6,378,388 m, and 1/f = 297.

Starting with specifics for the Gilbert Islands Group, for the Abaiang Datum of 1962, the Datum origin is at the first-order station Flagstaff of Government Station at (00° 27' 36" N and 173° 49' 11" E) on Christmas Island. The Austronesian group, for the Abaiang Datum of 1962, the Datum origin is at the first-order station Flagstaff of Government Station – Taburao. The local TM grid is based on the Transverse Mercator projection with the central meridian, λ0 = 172° 55' E, the False Easting = 20 km, and the False Northing = zero. The Scale Factor at Origin is unity (m0 = 1.0). From Abaiang Datum of 1962 to WGS 84 Datum, the converted Doppler solution is ΔX = +254.8 m, ΔY = –322.4 m, and ΔZ = –270.0 m. The Operation ANON 1984-85 solution is ΔX = +254.3 m, ΔY = –323.4 m, and ΔZ = –275.6 m.

For the Abemama Datum of 1944, the Datum origin is at Signal Station, southwestern tip of Steve Island (Station ‘Flag’), where Φb = 00° 27' 36" N and λb = 173° 49' 11" E.
of Greenwich. For the Abemama Datum of 1959, the Datum origin is at Cook Astro Point where \( \varphi_o = 00° 24' 19.02'' N, \lambda_o = 173° 55' 36.57'' E \) East of Greenwich, and \( H_o = 2.14 \) m. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_o = 173° 51' \) E, the False Easting = 20 km, and the False Northing = 100 km. The Scale Factor at Origin is unity \( (m_o = 1.0) \). From Abemama Datum of 1959 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +289.4 \) m, \( \Delta Y = +656.2 \) m, and \( \Delta Z = +303.4 \) m. Note that the UTM coordinates of local traverses depend on the position of Observation Spot that was connected by traverse to C where \( \varphi_o = 00° 24' 29.02'' N \) and \( \lambda_o = 173° 55' 36.57'' E \).

For the Arorae Datum of 1965, the Datum origin is at Arorae Astro Observation Spot where \( \varphi_o = 02° 38' 36.7'' S \) and \( \lambda_o = 176° 49' 33.3'' E \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_o = 176° 49' \) E, the False Easting = 10 km, and the False Northing = 500 km. The Scale Factor at Origin is unity \( (m_o = 1.0) \). From Arorae Datum of 1965 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +221.4 \) m, \( \Delta Y = -34.4 \) m, and \( \Delta Z = -21.6 \) m.

For the Beru Datum of 1970, the Datum origin is at third-order station BRZ 10 where \( \varphi_o = 01° 19' 29.9632'' S, \lambda_o = 175° 59' 16.9134'' E \) East of Greenwich, and \( H_o = 1.73 \) m. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_o = 175° 59' \) E, the False Easting = 10 km, and the False Northing = 300 km. The Scale Factor at Origin is unity \( (m_o = 1.0) \). From Beru Datum of 1970 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +179.9 \) m, \( \Delta Y = -595.3 \) m, and \( \Delta Z = +6.96 \) m. The Operation ANON 1984-85 solution is: \( \Delta X = +181.3 \) m, \( \Delta Y = -585.6 \) m, and \( \Delta Z = -7.2 \) m.

For the Butaritari Datum of 1965, the Datum origin is at third-order station BTZ 26 where \( \varphi_o = 03° 15' 40.629'' N, \lambda_o = 172° 41' 45.8381'' E \) East of Greenwich, and \( H_o = 1.87 \) m. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_o = 172° 50' \) E, the False Easting = 20 km, and the False Northing = zero. The Scale Factor at Origin is unity \( (m_o = 1.0) \). From Butaritari Datum of 1965 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +253.8 \) m, \( \Delta Y = +6.1 \) m, and \( \Delta Z = +528.2 \) m. The Operation ANON 1984-85 solution is: \( \Delta X = +254.2 \) m, \( \Delta Y = +3.2 \) m, \( \Delta Z = +544.2 \) m.

For the Kuria Datum of 1962, the Datum origin is at HMS Cook Astro, Kuria 1962 where \( \varphi_o = 00° 13' 00.4'' N \) and \( \lambda_o = 173° 23' 06.8'' E \) East of Greenwich. The local Kuria and Aranaka Grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_o = 173° 30' \) E, the False Easting = 30 km, and the False Northing = 100 km. The Scale Factor at Origin is unity \( (m_o = 1.0) \). From Kuria Datum of 1962 to WGS 84 Datum, the converted Doppler solution is based on a fourth parameter where a Z-axis rotation is performed first (algebraically added to the longitude), where \( R_z = 102.84765'' \) and then the standard three-parameter shift is performed where \( \Delta X = +219.1 \) m, \( \Delta Y = -24.9 \) m, and \( \Delta Z = +137.0 \) m. The Operation ANON 1984-85 solution is \( R_z = 102.804" \), \( \Delta X = continued on page 783
continued from page 781

\[ X = +188.1 \text{ m}, \Delta Y = -237.6 \text{ m}, \text{and} \Delta Z = -185.6 \text{ m}. \]

For the Little Makin Datum of 1972, the Datum origin is at station Bikati A stro where \( \phi_0 = 03^\circ 16^\prime \ 19.90^\prime\prime \text{N} \text{and} \lambda_0 = 172^\circ 40' \ 36.21^\prime \text{E} \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 172^\circ 50' \text{E} \), the False Easting = 20 km, and the False Northing = zero. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Little Makin Datum of 1972 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = 422.9 \text{ m}, \Delta Y = -38.4 \text{ m}, \text{and} \Delta Z = -311.7 \text{ m}. \)

The Operation ANON 1984-85 solution is \( \Delta X = 420.3 \text{ m}, \Delta Y = -17.7 \text{ m}, \text{and} \Delta Z = -315.3 \text{ m}. \)

For the Nonouti Datum of 1965, the Datum origin is at SW Point A where \( \phi_0 = 00^\circ 39' \ 57.7067^\prime\prime \text{S} \text{and} \lambda_0 = 174^\circ 26' 52.1428^\prime \text{E} \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 174^\circ 20' \text{E} \), the False Easting = 20 km, and the False Northing = 200 km. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Nonouti Datum of 1965 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = 422.1 \text{ m}, \Delta Y = -96.3 \text{ m}, \text{and} \Delta Z = -935.1 \text{ m}. \) Note that the UTM coordinates of local traverses in 1963 of the Nououti Survey depend on the position A being \( \phi_0 = 00^\circ 40' \ 16.4^\prime \text{S} \text{and} \lambda_0 = 174^\circ 27' 28^\prime \text{E} \).

For the Oronoto Datum of 1970, the Datum origin is at third-order station ONZ 7. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 175^\circ 33' \text{E} \), the False Easting = 10 km, and the False Northing = 350 km. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Ononoto Datum of 1970 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = 244.4 \text{ m}, \Delta Y = -197.9 \text{ m}, \text{and} \Delta Z = -243.1 \text{ m}. \) The Operation ANON 1984-85 solution is \( \Delta X = 245.2 \text{ m}, \Delta Y = +203.7 \text{ m}, \text{and} \Delta Z = -248.4 \text{ m}. \)

For the Tabiteua Datum of 1959, the Datum origin is at third-order station TBZ 1 Astro where \( \phi_0 = 01^\circ 28' \ 05.6^\prime \text{S} \text{and} \lambda_0 = 175^\circ 03' 15.0^\prime \text{E} \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 175^\circ 53' \text{E} \), the False Easting = 30 km, and the False Northing = 300 km. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Tabiteua Datum of 1959 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = 250.8 \text{ m}, \Delta Y = +235.6 \text{ m}, \text{and} \Delta Z = +377.2 \text{ m}. \)

For the Tamana Datum of 1962, the Datum origin is at Astro Observation Spot where \( \phi_0 = 02^\circ 30' 09.0^\prime \text{S} \text{and} \lambda_0 = 175^\circ 58' 45.8^\prime \text{E} \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 175^\circ 59' \text{E} \), the False Easting = 10 km, and the False Northing = 400 km. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Tamana Datum of 1962 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +202.3 \text{ m}, \Delta Y = -811.6 \text{ m}, \text{and} \Delta Z = +128.2 \text{ m}. \) The Operation ANON 1984-85 solution is \( \Delta X = +206.8 \text{ m}, \Delta Y = -159.8 \text{ m}, \text{and} \Delta Z = +495.7 \text{ m}. \)

For the Kanton Datum of 1963, the Datum origin is at first-order station Kanton SECOR AM 1966 where \( \phi_0 = 11^\circ 21' 42.13^\prime \text{N} \text{and} \lambda_0 = 172^\circ 55' 47.27^\prime \text{E} \) East of Greenwich. The local grid is based on the Transverse Mercator projection with the central meridian, \( \lambda_0 = 173^\circ 02' \text{E} \), the False Easting = 20 km, and the False Northing = zero. The Scale Factor at Origin is unity \( (m_0 = 1.0) \). From Kanton Datum of 1963 to WGS 84 Datum, the converted Doppler solution is \( \Delta X = +176.0 \text{ m}, \Delta Y = -421.8 \text{ m}, \text{and} \Delta Z = +282.3 \text{ m}. \) The Operation ANON 1984-85 solution is \( \Delta X = +184.0 \text{ m}, \Delta Y = -356.3 \text{ m}, \text{and} \Delta Z = +287.5 \text{ m}. \) For the Betsy Anchorage Survey of 1959, note that the UTM coordinates of local traverses depend on the position C being \( \phi_0 = 01^\circ 19' 42.98^\prime \text{N} \text{and} \lambda_0 = 172^\circ 58' 31.747^\prime \text{E} \).

For the Line Island group, according to John W. Hager, the origin is at Station Beacon on Kiritimati (Christmas Island) where \( \phi_0 = 01^\circ 59' 38.57^\prime \text{S} \text{and} \lambda_0 = 157^\circ 35' 20^\prime \text{W} \) West of Greenwich. Established by N. J. Till, hydrographic surveyor, M.N.Z.I.S. in April-September 1941. English Harbor Observation Post on Tabuaeran (Fanning Island) is the Datum origin where \( \phi_0 = 03^\circ 51' 23^\prime \text{N} \text{and} \lambda_0 = 159^\circ 21' 50^\prime \text{W} \) of Greenwich.

For the Phoenix Island Group, Birnie Island Astro is where \( \phi_0 = 03^\circ 35' 07.875^\prime \text{S} \text{and} \lambda_0 = 171^\circ 31' 03.194^\prime \text{W} \) West of Greenwhich. Kanton 1939 Datum at the American Eclipse Expedition Pier, USS Bushnel where \( \phi_0 = 02^\circ 49' 07.2^\prime \text{S} \text{and} \lambda_0 = 171^\circ 42' 53.5^\prime \text{W} \) West of Greenwich. The position is described as a monolith on the western side of the island. Kanton 1963 is where \( \phi_0 = 02^\circ 47' 20.0^\prime \text{S} \pm 0.3^\prime \text{S} \text{and} \lambda_0 = 171^\circ 39' 49.0^\prime \text{W} \pm 0.3^\prime \text{West of Greenwich, and the reference azimuth is} \alpha = 75^\circ 15' 19.15^\" \pm 0.15^\" \text{to CA N A21 from south (USCGS2 second order). Canton Astro 1966 at Canton SECOR Aastro is where} \phi_0 = 02^\circ 46' 28.99^\prime \text{S} \pm 0.04^\prime \text{S} \text{and} \lambda_0 = 171^\circ 42' 53.5^\prime \pm 0.05^\prime \text{West, and the azimuth} \alpha = 385^\circ 51' 02^\prime 65^\" \pm 0.11^\" \text{(ISIC). Continued on page 784.
from SECOR RM-1 to TBM #3 (SECOR AZ MK) from South, referenced to the International 1909 ellipsoid. Enderbury Island Astro Datum is where $\Phi = 03^\circ 08' 30.140"$ S, $\Lambda = 171^\circ 05' 34.95"$ West of Greenwich, and the reference azimuth is $\alpha = 179^\circ 04' 00.69"$ to Bas. The Gardner Island Astro Datum is where $\Phi = 04^\circ 40' 18.85"$ S, $\Lambda = 174^\circ 32' 27.71"$ West of Greenwich, and the reference azimuth is $\alpha = 252^\circ 25' 24.41"$ to station Line. The Hull Island Astro Datum is where $\Phi = 04^\circ 29' 15.263"$ S, $\Lambda = 172^\circ 10' 15.188"$ West of Greenwich, and the reference azimuth is $\alpha = 252^\circ 25' 24.41"$ to station Base. The McKean Island Astro Datum is where $\Phi = 03^\circ 35' 51.375"$ S, $\Lambda = 174^\circ 07' 37.522"$ West of Greenwich, and the reference azimuth is $\alpha = 205^\circ 04' 59.26"$ to station North. The Phoenix Island Astro is where $\Phi = 03^\circ 43' 13.375"$ S, $\Lambda = 170^\circ 42' 56.004"$ West of Greenwich, and the reference azimuth is $\alpha = 309^\circ 23' 37.76"$ to station South. Sydney Island Astro Datum is where $\Phi = 04^\circ 26' 57.975"$ S, $\Lambda = 171^\circ 15' 43.885"$ West of Greenwich, and the reference azimuth is $\alpha = 009^\circ 45' 57.97"$ to station Nee. For the Line Islands Group and the Phoenix Islands Group, the ellipsoid of reference is the Clarke 1966 unless otherwise noted.

Thanks again go to Russell Fox of the U.K. Ordnance Survey; John W. Hager, retired from AMS/DMA/NIMA; and Richard W. Stevenson, head of the Reference and Bibliography Section, and Gary Fitzpatrick, senior reference librarian, both of the Library of Congress; and David Llewellyn, senior draftsman, Lands and Survey Division, Bairiki, Tarawa, Republic of Kiribati.

Cliff Mugnier teaches Surveying, Geodesy, and Photogrammetry at Louisiana State University. He is the Chief of Geodesy at LSU's Center for Geoinformatics (Dept. of Civil and Environmental Engineering), and his geodetic research is mainly in the subsidence of Louisiana and in Grids and Datums of the world. He is a Board-certified Photogrammist and Mapping Scientist (GIS/LIS), and he has extensive experience in the practice of Forensic Photogrammetry.

**2002-2003 IGIF Student Awards**

The International Geographic Information Foundation (IGIF) proudly announces the continuation of its two student award programs. These awards are based on merit for significant contributions to the fields of mapping and the spatial sciences.

**Best Student Paper**

One or more awards of $1000 or less will be given for the best student paper at a Conference sponsored by one of the IGIF's member societies in 2003. To be eligible, the paper must be accepted through the normal approval process for this event. It may be authored by more than one person, but the lead author must be a registered graduate student from an accredited college or university, and that student must take the lead in presenting the paper at the specified conference in 2003. If a Proceedings volume of papers single-authored papers.

**Best Proposed Research**

One or more awards of $2000 will be given for the best research proposal by a graduate student. The award(s) will be presented at a Conference sponsored by one of the IGIF's member societies in 2003. An initial grant of $1500 will be made at the time of the award. It is expected that the proposed research will be sufficiently completed so that the results of the project can be reported in a paper presented at a conference in the year, 2004, selected by the Awardee from those sponsored by one of the associations or societies supporting the IGIF. The Awardee must have the paper accepted through the normal approval process for the conference. If a Proceedings volume of papers presented during the event is published, the paper must appear in that publication. A final $500 will be awarded following these events.

**ESRI/IGIF Student Scholarship Awards**

The International Geographic Information Foundation (IGIF) is pleased to announce the availability of three (3) to five (5) ESRI/IGIF student scholarship awards amounting to $1000 each for 2002-2003. This unique scholarship program is made possible through the generous IGIF Endowment established by Laura and Jack Dangermond and the Environmental Systems Research Institute (ESRI).

The ESRI/IGIF student scholarship awards will be presented at a Conference sponsored by one of IGIF's member societies in 2002-2003.

**Application Information:**

ESRI/IGIF Scholarships are available to full-time students who are currently registered in an undergraduate or graduate degree program providing either a degree or an explicit specialization in some area of applied spatial data analysis or geographic information system (GIS) study at a duly accredited and recognized college, university or other educational institution located within the United States of America. Applications for an ESRI/IGIF Scholarship must be made in the form of a letter no more than three (3) pages in length and supplemented, if necessary, by no more than two (2) pages of supporting illustrations.

This letter should specifically address how the ESRI/IGIF Scholarship funds will be used. A copy, the letter should indicate the career goals of the student and how these funds will assist in meeting those goals.

Each student’s application must be accompanied by a letter from the student’s faculty advisor with an endorsement from the chairperson of the applicable department. A brief curriculum vita of the applicant and a copy of the applicant’s most recent transcript must accompany the application.

For complete application information, visit [www.igif.org](http://www.igif.org)
